UX Design for Marc - Command Center

Invited Supreo Mukhopadhyay Tanmay Jyot Nasahn Sheppard Muddu Sudhakar Aditi Sharma Alex Kahng Shantanu Singh ~~Neha Bharati~~

Attachments UX Design for Marc - Command Center

Meeting records Transcript

Summary

Discussions centered on visualizing agent service graphs and prioritizing a simplified consumer-grade user experience for launch.

CMDB Service Graph Integration
Integration of agents into the service graph enables mapping connectivity and access permissions. This provides visibility into agent surface areas and potential policy violations.

Visualization and User Experience
The team prioritized defining a minimum viable experience to avoid overly complex, military-style dashboards. Zooming mechanisms and workflow drop-off tracking are core components of this design.

Demonstration Use Case Finalized
The demonstration will feature an IT director identifying a rogue agent and remediating the issue. This scenario replaces neutralization with comprehensive agent evaluation updates.

Next steps

- [ ] [Alex Kahng] Redline Document: Redline existing feature documentation to eliminate non-essential items. Focus scope for Minimum Viable Experience delivery.
- [ ] [Alex Kahng] Define MVE: Write a stack rank of features. Sync with Muddu to define the Minimum Viable Experience requirements.
- [ ] [Aditi Sharma] Refine Visuals: Perform a visual pass on the current design. Use cursor prompts to achieve consumer-grade aesthetics, soft corners, and professional fonts.
- [ ] [Aditi Sharma] Create Storyline: Create a detailed natural language story line for the IT Director user case. Send the use case scenario for review.
- [ ] [Alex Kahng] Review Scenario: Asynchronously review the use case scenario provided by Aditi.

Details

- **CMDB Service Graph Integration and Agent/User Mapping**: Muddu Sudhakar emphasized the need to map agents and users into the Configuration Management Database (CMDB) service graph, which is gaining traction in the industry. The goal is to show the connectivity and persona of agents and users in a graph, similar to the existing IT service graph where CI classes include nodes, routers, switches, apps, and services, with agents and users becoming new classes. They also mentioned that this view should be an extension of or overlap with the existing service graph, citing examples like Microsoft Graph and Google's Viz Graph (00:01:04).
- **Granularity of the Service Graph View**: The team discussed the level of detail required for the audience, specifically mentioning Mark, who Muddu Sudhakar suggested prefers granular views. Alex Kahng suggested that the current high-level cluster view could be used, but clicking on an "attention required" item or a specific part of the map should lead to a more detailed, high-fidelity view (00:02:10). Muddu Sudhakar clarified that the focus should be on IT services and

not include categories like contact center or field service for the initial launch (00:03:02).

- **Visualizing Agent and User Access Permissions**: Muddu Sudhakar requested a deeper drill-down view that shows agents' and users' coexistence with access permissions to what they are running, such as admin or read privileges. This core information, which highlights the agent's surface area of access (e.g., to Box, Cloudflare, Cisco switches), should be placed in the main central area of the display, not in a small side panel (00:04:29) (00:07:32). The system should also highlight violations of predefined policies (like a "ten commandments") with an exclamation point, as agents are expected to adhere to policies (00:05:19).
- **Scope of Agent Management and Access Controls**: Aditi Sharma inquired whether the user of the dashboard is managing all agents or only synthesizing deep-dive information for one agent, to which Muddu Sudhakar stated that one person in the future state will likely perform both management and deep analysis across the spectrum, reflecting the collapsing of roles due to AI. Muddu Sudhakar clarified that user access (e.g., read/write access to SharePoint or GitHub) and agent surface area (access to apps and services) are critical components to be visualized in the graph (00:06:38).
- **Zooming and Filtering Mechanism for Visual Data**: Nasahn Sheppard proposed a "Powers of 10" concept, allowing users to zoom in and out of the agent world, from a high-level overview to the atomic detail of an individual agent (00:07:32). They suggested having hotspots and simple filtering mechanisms (e.g., showing only agents in Los Angeles or those working on shipping) that reorientate the map, rather than having isolated graphs and tabs (00:08:22). Nasahn Sheppard also noted that an alerting mechanism is needed to pierce through the high-level view and take the user directly to a point of action when something happens (00:10:10).
- **Workflow Analysis and Agent Drop-Off Points**: Muddu Sudhakar stressed the importance of monitoring workflows and identifying at what step an agent is "dropping off," similar to abandoning a shopping cart, leading to escalation to a human (00:11:13). This workflow information, which can be non-linear and agentic, should be shown, possibly on the right side panel when a specific agent is selected, to help fix poorly designed steps (00:12:02). Shantanu Singh clarified that the display should show the original workflow and where it is breaking, such as due to unauthorized access (00:12:54).

- **Simplifying the User Experience and Minimum Viable Experience (MVE)**: Nasahn Sheppard critiqued the current visualization for being overly complex, resembling Palantir and opening more questions than answers (00:13:47) (00:16:34). They urged the team, and Alex Kahng specifically, to define the "minimum viable experience" (MVE) by focusing the story, removing unnecessary complexity, and concentrating on the core mechanisms of zooming, filtering, and workflow visualization (00:14:26). Alex Kahng agreed to write down a stack rank of features to help simplify the scope for the team (00:16:34).
- **Visual Design and Consumer Grade Aesthetic**: Nasahn Sheppard emphasized the need for a visual pass to make the design more "consumer friendly," aligning with Service Now's visual and design direction, moving away from a "military command center" or "Palantir-ish" style (00:17:18) (00:22:09). They suggested using tools like Cursor to apply prompts for a more consumer-grade appearance, including softer corners and easier calls to action (CTAs), while keeping the dark theme. Aditi Sharma clarified that their current design rationale was based on a "situation room" concept, which is why it resembled Palantir Gotham (00:19:17) (00:21:11).
- **Token Limitations and Resource Constraints**: The discussion shifted to the critical problem of running out of design tokens for tools like Cursor and Figma, limiting the ability to progress with the visual design (00:23:04). Nasahn Sheppard suggested a temporary hack of exhausting other people's tokens or escalating the issue to Dan Leoff or Yakov. Alex Kahng noted an announcement about unlimited tokens for Human Agent Productivity but acknowledged the team might not be covered by that yet, suggesting pairing off with an engineer as a temporary solution (00:24:41).
- **Defining the Use Case Scenario for the Demonstration**: Alex Kahng and Aditi Sharma discussed defining a specific use case for the presentation, centering on an IT director at Home Depot managing agents deployed across various systems (Agent Force, Co-Pilot, third-party MCPs) (00:39:25). The primary issue is a "rogue agent" that needs to be caught and neutralized, but Alex Kahng pushed for a more comprehensive scenario where the IT director remediates the issue by updating the agent's evaluation (eval) set and redeploying it, rather than just neutralizing it, to prevent the issue from reoccurring (00:41:56).
- **Zoomed-In View and Remediation Process**: Alex Kahng provided a detailed narrative for the IT director's experience: seeing a zoomed-out CMDB-type view, identifying a rogue agent violating policy (e.g., using too many tokens, giving DIY advice) (00:45:39). The director should be able to zoom in to see the agent's

"blast radius" across affected customers, view the agent's architecture and the problematic node in the agentic workflow, and ultimately trigger a re-assessment or change of the agent's evals (00:47:19). The successful remediation would be visualized by seeing the rate of warnings decrease from, for example, three every minute to zero (00:48:35).

UX Design for Marc - Command Center - Transcript

00:00:00

Muddu Sudhakar: more than this look at our CMDB service graph and look at the Google's vis graph so you that's what Alex and me are thinking is still see agents are still need to be mapped into CMDB there at least the service now view that's getting traction is and I was there today at human x conference a lot of people are discussing that I went to all the booths and looked at various guys I also met with what a um the thinking the open AI guys are doing in the business side remember I mentioned this guy called Sinwas Naran and so what he all these guys are thinking is they'll be in some database and I talked to Madav also Nasha I met with Madav today he and Rob Simon were there at the event as well so I talked to Mad and Mad is obviously thinking we should he's he did not know about the CMDB site that service is doing he's thinking the data is going to be stored in some Salesforce database but the issue is not just showing the database showing the connectivity of the agent and users in some graph needs to be there First before this uh I understand this comes in more from a threat perspective.

00:01:04

Muddu Sudhakar: Aditi first showing the persona of the agent and like I want to see agents and users and say this agent what did the persona it derived and which agents are connected to which users that graph we need to have some kind. So think of very similar to what the graph we have in IT service today. Just go look at the service graph that we have. It should be an extension of that or overlap into that. Today there you have the CI classes includes nodes, routers, switches, apps, services. Agent is just one more class user also will become one more class into that. Other example of people talked is the Microsoft graph. So you have Microsoft graph an example. You have vizg graph from um from Google as an example. And obviously this is what the thinking of NAT land graph etc this third party company.
Tanmay Jyot: the

Muddu Sudhakar: So we need to show that agents and users and services in one graph first to start with then in that overlay where this coming in. So this is not going to be an isolated go

00:02:10

Tanmay Jyot: mud one sorry um so one thought mud we had
Muddu Sudhakar: ahead.
Tanmay Jyot: because the the audience is Mark here um that's why we thought that if he shows service graph and all of those thing it would be too granular for him is what we thought that's why we took this example which is little uh
Muddu Sudhakar: He likes to be granular to what I've seen
Alex Kahng: would it be something that we would show when we click on attention required?
Muddu Sudhakar: it.
Tanmay Jyot: okay
Alex Kahng: Can we click on that again and see what it would look like? Because this could be a higher level view,
Muddu Sudhakar: Yeah,
Alex Kahng: but once you click on this
Muddu Sudhakar: maybe start this one. See what you just showed that he'll throw them off. Even here somehow you have to show Alex the you already have the service graph and nodes and
Alex Kahng: Sure.
Muddu Sudhakar: ages. Now you want to populate whether on that users and agents.
Alex Kahng: But um all I I'm saying is if you zoom out of a a service graph and just look at the highle clusters, you might get a view that's similar to what we started with.

00:03:02

Muddu Sudhakar: Yeah.
Alex Kahng: Once you click on an indiv like a certain part of that map, you should start seeing everything right.
Muddu Sudhakar: Okay.
Alex Kahng: It should be high fidelity, high visibility.

Muddu Sudhakar: service don't do it by contact center field service etc. I don't want to see that.
Shantanu Singh: No,
Alex Kahng: Yeah,
Shantanu Singh: no,
Muddu Sudhakar: This is he looks at all the view.
Shantanu Singh: that's what what
Alex Kahng: I think this should be a service graph right here.
Muddu Sudhakar: It should be only IT service.
Alex Kahng: It's showing 60,000 users,
Muddu Sudhakar: Huh?
Shantanu Singh: Alex
Alex Kahng: 34 agents probably.
Muddu Sudhakar: I know but on the right side it's saying field service commerce cloud etc.
Alex Kahng: Yeah. Yeah. I think ignore the the the exactly how it's visualized right now.
Muddu Sudhakar: I can't ignore that. I mean right now I can ignore it but from Marble when we lose this thing we are going to launch with IT service let's say. So all should be on the
Shantanu Singh: There is no text here.

00:03:41

Shantanu Singh: No, there is no requirement or text.
Muddu Sudhakar: service.
Shantanu Singh: It's the text you can say what we want to add. We can change if there is time. But it's just we're coming up with things on completely abstract blank basis. We can change it to field service to anything which makes sense. But the the flow which Aditi was showing which Alex meant is from here if you zoom out you get to the location. Can you go there Aditi?
Muddu Sudhakar: Yeah, keep doing.
Shantanu Singh: This is the very high level and when you go inside anything you can get to see the service graph.
Muddu Sudhakar: Okay.
Shantanu Singh: In the previous one on top you see we are showing by region we can also show by department and operation. We don't have those screens but we thought that okay if user wants to see department wise that which department where all

Muddu Sudhakar: I'm fine with this.
Shantanu Singh: AI agents are there wise.
Muddu Sudhakar: So that is fine. I think yeah Shantra I'm fine. I don't have anything.

00:04:29

Muddu Sudhakar: All I'm saying is to for me to get to the meeting in a small meeting uh we don't have the ability to start to the from high level to examine. I just want to directly jump into the bottom most layer and then explain them. But this is fine. I mean we can keep this what you have but I think can you click on this one if I go one more level deep what I want to see Shanti is from here I want to go to user agents coexistence with access permissions to what they're running Alex you see what I'm
Alex Kahng: Yep.
Aditi Sharma: So you can get into the agent and you can see like
Muddu Sudhakar: saying yeah but I want that to be in
Alex Kahng: Yep.
Aditi Sharma: what
Muddu Sudhakar: the on the left side not in this small right side that should be your score your core should be this
Aditi Sharma: Okay.
Muddu Sudhakar: page not some side thing see what you have to understand look as a user let's say I'm
Aditi Sharma: Right. This

00:05:19

Muddu Sudhakar: Aditi I have access to box I have access to this that's what we're showing in our service graph now this
Aditi Sharma: one
Muddu Sudhakar: agent called let's say networking agent what does it have access to it has zcalar access it has cloudflare access it can do cisco switches when it does this it has admin privileges or it has a root privileges or it can do read so I want to show that and if I see this guys misbehave and also highlight with a exclamation whenever it violated some policy each agent are given a a policy think of like a ten commandments whenever it violates those then I think agents will be more likely to follow a policy than

humans we are humans don't follow policies but that was the whole discussion also yesterday and today at the
Aditi Sharma: So,
Muddu Sudhakar: conference so we want to highlight that you know I like that
Aditi Sharma: so I've highlighted like what policies were uh violated.
Muddu Sudhakar: but the is the drill down again absolutely
Aditi Sharma: So I have one follow-up question udu sorry like I want to understand the person who's looking the user who's looking at this are they managing all the agents that are being deployed or are they looking at like is their job to look at this timeline and see how their other agents are doing across like different uh you know like the different parts of the flow or is their job to like really synthesize and go deep down into one agent because those I feel are different use cases.

00:06:38

Muddu Sudhakar: I think everything right you not have you won't have it's like what I think everything think of like a spectrum you're not going to have different people doing different things in the future state guys I think people are going to collapse one person has to do everything a is doing everything you're not going to have some guy doing a small piece I mean the people are collapsing the role so much the AI is compressing even the IT level there's no L1 L2 L3 it's like the same person who creates the agent same person who creates a workflow same person is actually manages it uh
Aditi Sharma: And when you say access to users, what does that exactly
Muddu Sudhakar: users will have so today when a user has access to certain things right I can do box as an
Aditi Sharma: mean?
Muddu Sudhakar: access if I have box or I have access to a shareepoint and do I have a read access right access like how users have access controls Think of what's happening. You have certain access control within the Salesforce. What do you have access to?

00:07:32

Muddu Sudhakar: Maybe you don't have Jitab access or maybe you have. So showing all the apps and services the user have access to as a surface area. That's what is

surface area means. Similarly for agent what is the surface area for this particular agent?
Aditi Sharma: right? Okay. Like access to everything that they
Muddu Sudhakar: Yeah,
Aditi Sharma: have.
Muddu Sudhakar: that needs to be shown in the graph not on this right side that you are showing.
Aditi Sharma: Got it.
Muddu Sudhakar: That should be in the center piece of left
Aditi Sharma: Got it.
Tanmay Jyot: Yes.
Alex Kahng: Turn the sign. You're
Tanmay Jyot: So I think
Nasahn Sheppard: Maybe maybe another way another way to think about this is
Muddu Sudhakar: side.
Alex Kahng: muted.
Nasahn Sheppard: um you all remember that movie Powers of 10 from a long time ago where you can magnify down to an atom all the way up to the solar system and basically you can zoom in and out, right? So you can have your like I can look at the world of my agents.

00:08:22

Nasahn Sheppard: I can see hotspots in that. I can I can pierce right down into that agent and when I go into that agent visually, it pulls up that information around that agent, right? I can zoom back out of that. It decomposes that information, but I can go someplace else. And that way, it's not like graphs on one side and sort of a bunch of tabs and other things on other sides. It's just the ability to like look and then spearfish right down into where there's issues or have those surfaced up to me in a way that's very very simple and very very
Muddu Sudhakar: I think Nashan got it guys.
Nasahn Sheppard: easy.
Muddu Sudhakar: Uh but again what shows in that we have to again you can filter it out. For example, you can say show me only agents as a key or show me users.
Nasahn Sheppard: That's right. Show show me only agents that do this. Show me only agents in Los Angeles. Show me only agents that are working on shipping. Show me only agents whatever.

00:09:15

Nasahn Sheppard: like that's the agent force conversation component and it and it reorientates the map and so uh I think
Muddu Sudhakar: Yes, you you're getting it. You're getting it again. See, that's kind of the whole control tower view, Nashan. So that people So idea is Microsoft graph.
Nasahn Sheppard: that
Muddu Sudhakar: Microsoft graph, if there's any videos, take a look at it. Micro graph is pretty good today for users, but they don't have agents. Service Now go has it in the CMDB, but we don't have the pictures of those
Nasahn Sheppard: DT does that make sense what I'm thing like in 10
Muddu Sudhakar: yet.
Aditi Sharma: Yeah. So like a place where bird's eye view and fish eye view can the user can switch between both like if you want to deep dive into something versus
Tanmay Jyot: Yeah. So we can go still deeper. So this H019 if I click on it instead of something opening on the right it still goes deeper into it shows what are the connectors where all um basically service graph which we have something like

00:10:10

Aditi Sharma: Red,
Tanmay Jyot: that and we say that what are the things that are going wrong.
Nasahn Sheppard: Yeah.
Tanmay Jyot: Yeah.
Nasahn Sheppard: Yeah.
Muddu Sudhakar: And again,
Nasahn Sheppard: You just zoom right into that area.
Muddu Sudhakar: you Please sir.
Nasahn Sheppard: Information comes up and you can pull out of it.
Aditi Sharma: red.
Nasahn Sheppard: And then you can we just need a filtering mechanism whether that's asking for what you want to see or some filtering mechanism that can then change that. Like it could be show me agents geographically. Boop, there's a map. Show me agents that are only working on X. Boop. Map's gone. And there's, you know, whatever your

agents look this way. Show me agents that are only working on uh hardware. Boop. there they are, right? You know, like that sort of thing. And then with hotspots, um, and then I think we also would need some alerting because you may be looking at something geographical, if you will, and something happens somewhere else. You need ability to have an alerting mechanism piercing through that can then you can click on that alert and it can take you right to the point of action of exactly where you need at that moment.

00:11:13

Muddu Sudhakar: I think Nashan you got it. I think something like that we can explain and monitor and then obviously activity overlay. One thing other thing Nashan we have to do is think about the workflows. So one big thing is called this is something we spend time talking to um Tina and Joe and Zerello what what we want to know is at what point of the workflow agent is dropping off say workflow is very serious of steps even for an agent if it is dropping off and we need to learn from that as well so that we can fix our agents and the agent graphs you see what I'm
Nasahn Sheppard: So would that be then so if you're if you if you like you go down to HS019 as example if I look at that agent wouldn't the workflow then be the information that's populating on the right side or on the bottom or whatever where I can see sort of almost like a yeah a
Muddu Sudhakar: could be Yeah, it could be on the right side too. Yeah. And then

00:12:02

Nasahn Sheppard: graph a graph of that workflow and uh you know all the grounding
Muddu Sudhakar: that
Nasahn Sheppard: information all the kind of steps of you know the ability to kind of like understand that is that what you're
Muddu Sudhakar: that's what so think of like maybe the right side as you're saying it then when the agent is traversing the workflow
Nasahn Sheppard: saying
Muddu Sudhakar: the workflow is again designed by human or agent and some maybe it's not designed correctly the it's dropping off in the sense think of like in the shopping cart you're trying to buy things you abandon the cart so like that in a workflow for a

password reason that step people don't like it and it's dropping off and they're saying escalating to a human. So then you know that step needs to be
Nasahn Sheppard: Okay.
Muddu Sudhakar: fixed.
Nasahn Sheppard: Is that um is that more of a linear set of
Muddu Sudhakar: It's not linear. There could be loops workflows that Alex does. It could be loops.
Nasahn Sheppard: instructions?
Muddu Sudhakar: It could uh it could be deterministic.

00:12:54

Muddu Sudhakar: It could have been nondeterministic steps. That's why we becomes agentic workflow. Workflow by difference is no longer rulebased or
Shantanu Singh: So here in in this screen what Aditi is trying to show that off pipeline
Muddu Sudhakar: deterministic.
Shantanu Singh: you know unauthorized access that's where the workflow is breaking. What Mudu is asking probably is to see what was the original workflow and here is where it's breaking.
Aditi Sharma: But that's what like the original workflow like all these agents are within the workflow. You can see like there's agent to agent.
Shantanu Singh: So this is the workflow here what you have intake schedule FS and completion and this is where it's breaking
Aditi Sharma: Yeah.
Shantanu Singh: and going into some other
Aditi Sharma: of the
Muddu Sudhakar: Hey, can you just wrap up here? I'll go to the other meeting with Ram Prasad.
Shantanu Singh: pipeline.
Aditi Sharma: pipeline.
Alex Kahng: Yes.
Muddu Sudhakar: Okay. Thanks guys. I think Alex will tell you.
Alex Kahng: Okay.
Muddu Sudhakar: Let's I think we are getting better. See what you one more iteration with Nashan what he suggested guys.

00:13:47

Muddu Sudhakar: Thank you.
Alex Kahng: Yep.
Aditi Sharma: Sure.
Alex Kahng: Yeah. I think uh my two cents it's um thank you so much for pushing on this. This looks like a very good first pass in my opinion. It tells the story. Um, we probably just need to tighten up in the areas that Moodu mentioned. Um,
Nasahn Sheppard: I al I also I think there's just too much stuff in here too.
Alex Kahng: and maybe
Aditi Sharma: Those
Nasahn Sheppard: Like like uh this feels like it feels like Palanteer.
Alex Kahng: Yeah. Yeah.
Nasahn Sheppard: Like it's just it's like a like we're going to do a nuclear strike or something.
Alex Kahng: That was my first thought. is this
Nasahn Sheppard: I don't know. Like maybe too sick. But so so um
Aditi Sharma: were examples that were given Nan Gotham by piling to you.
Alex Kahng: is
Shantanu Singh: It was inspired
Nasahn Sheppard: what's that?
Aditi Sharma: Those were the examples given to me.
Shantanu Singh: by
Nasahn Sheppard: Yeah. No, no, no.

00:14:26

Aditi Sharma: Gotham by P.
Nasahn Sheppard: Look, this is not this is not a knock on you, DT. This is I I'm I'm can't even believe we have this to even talk about after a few hours. Um uh I think it's more along the lines of like how do we start to just to focus the story? How do we like throw stuff off the side of the boat so that we can make sure that it's it's crisp and then we you know focus on the mechanisms of being able to zoom into an agent and zoom out filter through those things and the look at
Shantanu Singh: Jesus.
Nasahn Sheppard: workflows.
Alex Kahng: Oops.

Nasahn Sheppard: If it's just those things very simply then you know um all the other complex I mean this is not a design that's a it's a concept car right like um you know and if you get into the granular details of how does this work
Alex Kahng: Yeah.
Nasahn Sheppard: and how does that work it's like I don't know good question right but um uh and so Alex I think where you can help steer is like what's the minimum viable experience that we need what's like the MVE not not the everything we need but the things that are going to be like you know cool got that or just a nod to it

00:15:22

Alex Kahng: Yeah.
Nasahn Sheppard: and then everything else let's just kind of like bury that complexity to make the work on the team lighter and simpler to make the this concept just much more groable and understandable to to to anybody in green
Alex Kahng: Agreed. I think so when uh Shantenu prefaced the the UX walkth through with um like these are the basic success criteria just want to like get everyone on the same page. I wasn't expecting something that's so uh that went through all the details. I think it it does the maximum.
Nasahn Sheppard: Yeah.
Alex Kahng: It doesn't.
Nasahn Sheppard: So, Alex,
Alex Kahng: So
Nasahn Sheppard: can you can you help to whatever document you have with with the team, uh, can you help to just just, you know,
Alex Kahng: yeah.
Nasahn Sheppard: redline that out and be like, "Nope, nope, nope, nope, nope." And that gives then, you know, the team just the ability to like focus on only the most important silly things for an MVE.
Alex Kahng: I see. I don't I'm not sure if Okay. Do you think Mudu is aligned on that?

00:16:34

Alex Kahng: Like if we don't have the ability to talk through red teaming for example, is that something he will miss?

Nasahn Sheppard: I don't I don't know. But right right now we have a s***
Alex Kahng: Yeah. Yeah. Right now it's too much.
Nasahn Sheppard: right now we have too much complexity and it's too confusing and there's too it opens more questions than
Alex Kahng: Yeah.
Nasahn Sheppard: answers. So somewhere between really really simple and what we have now is the answer. I I don't I don't know that.
Alex Kahng: Okay.
Nasahn Sheppard: I don't know if anybody on this call knows that, Alex. You you that's why I'm kind of putting it on your shoulders.
Alex Kahng: Yeah, I can write down a stack rank.
Nasahn Sheppard: Uh and so maybe you can go with go with Mudo and get crisp on it because I don't want I don't want my
Alex Kahng: Yeah.
Nasahn Sheppard: team to be hunting around in the dark on
Alex Kahng: Okay. So,
Nasahn Sheppard: it.
Alex Kahng: sounds good. I think we we can spend a couple more minutes uh to just get a stack rank of of

00:17:18

Nasahn Sheppard: Yep.
Alex Kahng: uh the all the features that we wrote earlier on the
Shantanu Singh: See we can start by removing things which are not required in this story or the minimal thing that we want to
Alex Kahng: document. Sure.
Shantanu Singh: show like the event log here the bottom thing we can just remove it we are not using
Alex Kahng: That's
Nasahn Sheppard: Yep. I mean, also like think of this,
Aditi Sharma: Okay.
Nasahn Sheppard: you know, like uh we all can see what Service Now does,
Alex Kahng: right.
Nasahn Sheppard: right? That's that's the image that's going to be locked into Mark's head. And so I know that you you ripped this together. We'll have to throw a visual pass on this just to make it, you know, a little more consumer friendly. Um because Service

Now is skating much more in a consumer grade, you know, visual and design. And so just that sort of ability to just where am I focusing? What's most important?
Aditi Sharma: Alex, is it possible to show uh like to give a very minimum BRD sort of thing.

00:18:09

Nasahn Sheppard: Yeah.
Alex Kahng: Awesome.
Aditi Sharma: So I know like this is the user. This is their what main day-to-day looks like. At this point I'm sort of like just trying to like imagine what the user does. Have imaginary use
Alex Kahng: Got it.
Aditi Sharma: cases.
Nasahn Sheppard: Even even Alex even Alex if you can just talk it out and have it transcribed uh then you know then a DT and the team can can uh can take that and you know turn it into like some sort of prompting to help not only us understand but also help the system to understand a
Alex Kahng: Right. Um, can you uh maybe create some structure for me on the document of what exactly what questions you want answered, which personas uh we want to hone in on? Um, I think we last time we did the brain dump of all the use cases. Um, yeah. So, I think we we should start with the document. I probably will have more clarity writing it out for
Nasahn Sheppard: Okay,

00:19:17

Alex Kahng: you.
Nasahn Sheppard: I'm going to leave you all to it. Um,
Alex Kahng: Okay. Yeah. Thanks so much,
Nasahn Sheppard: all right.
Shantanu Singh: Nan this visual pass that you're saying this meeting what Alex said is tomorrow when do
Alex Kahng: Nissan.
Shantanu Singh: we do that visual pass and

Nasahn Sheppard: Well, I mean you you I mean this is cloud code or cursor which you're using both
Shantanu Singh: second
Aditi Sharma: Cosure Lord with
Nasahn Sheppard: cursor.
Shantanu Singh: and
Nasahn Sheppard: I mean I think you you can also just you you can also just you know jin up some prompts for cursor to to make this you know uh you know more consumer grade soft corners you know uh
Aditi Sharma: God.
Nasahn Sheppard: you know you know like like imagine if you know Apple and intercom you know like you know created a thing blah you know like like I have done that with cursor where I've just I've given it instructions to uh design it in a way that visually maps towards these brands um not perfect, but it's better. Or things like the map of California, like, you know, make these, you know, realistic line art.

00:20:20

Nasahn Sheppard: Uh things of that nature. Just just sort of like prompting it out to get it uh closer to something that is um
Aditi Sharma: I I can do that.
Nasahn Sheppard: tastier.
Aditi Sharma: Nasan just something Alex uh lot of like so in the document the images that that example UX screen one and two it was sort of more towards like dark themed and like
Alex Kahng: Yeah. Yeah. I don't think it
Aditi Sharma: sort of like and you also mentioned like
Alex Kahng: should
Nasahn Sheppard: Dark theme is fine. Dark theme's I'm not talking dark theme. I'm just like it like like look at the screen that we're seeing now. It's like that's a blob. It's supposed to be California, you know? it it everything it's like it looks like command line con you know uh it looks like terminal event logging you know it's it's just it
Aditi Sharma: No.
Nasahn Sheppard: feels totally unthetical you're gonna you
Shantanu Singh: We we will simplify that. We'll simplify
Nasahn Sheppard: know you're going to compare that to service now like I just I don't want that to be a tripping

00:21:11

Shantanu Singh: that.
Nasahn Sheppard: point when it can be just an easily visual pass through cursor or cloud on
Aditi Sharma: Okay.
Nasahn Sheppard: this uh to simplify it up and you know make it make it more uh consumer
Aditi Sharma: Okay.
Nasahn Sheppard: uh grade friendly uh you know easier CTAs, softer corners, just things that I like even the font the font looks like you know uh war
Alex Kahng: Yeah.
Nasahn Sheppard: games from 1980. So and DT I know you know what I'm talking about.
Aditi Sharma: the in I know I know I'm just trying to give you I know I
Alex Kahng: Yeah.
Nasahn Sheppard: I know you know what I'm talking about. They're all that
Shantanu Singh: I I told her about the font yesterday.
Aditi Sharma: you're you're right you're I'm
Shantanu Singh: I told her about the font yesterday.
Nasahn Sheppard: stuff.
Shantanu Singh: The font is also uh their font.
Aditi Sharma: I'm just trying to explain my design
Shantanu Singh: Um here
Nasahn Sheppard: I
Aditi Sharma: rationale is the the prompt I was given yesterday was like a situation
Nasahn Sheppard: know.
Aditi Sharma: room so I naturally went towards palent Gotham and you

00:22:09

Nasahn Sheppard: Oh, no. You nailed Palunteer.
Aditi Sharma: know yeah
Nasahn Sheppard: Like this is this is Palunteer all day long.

Aditi Sharma: and yeah
Nasahn Sheppard: like like you know
Shantanu Singh: Max like Palentia by the
Nasahn Sheppard: uh I look I think I think you should
Aditi Sharma: that's what I thought like what if this works
Shantanu Singh: way.
Nasahn Sheppard: keep it dark mode. Uh you know I mean absolutely keep it dark mode but uh
Aditi Sharma: okay but dark mode like cursor or versel not
Alex Kahng: See?
Nasahn Sheppard: uh this this to me is just this is like too
Aditi Sharma: like balentry right like that's what you mean
Nasahn Sheppard: palunteer it's like two on the nose.
Aditi Sharma: gotcha gotcha
Nasahn Sheppard: Uh uh it it feels uh it feels more like you know military command center you know agents that are going to go out and kill people like I don't
Aditi Sharma: Okay.
Nasahn Sheppard: think that's the vibe we're we're trying to go after and so so you know think of like you know dark theme professional tools you know it's like proumer so like there's consumer right and then there's proumer right this is the professional consumer version of things, right?

00:23:04

Nasahn Sheppard: Clear,
Aditi Sharma: Not sure.
Nasahn Sheppard: focused, uh, approachable, powerful, you know, things, you know, things of that nature, right? And I love the ability to be able to zoom in and out. And that's sort of the dynamic like I could see thousands of agents and I can like hone down into something and then it comes up and then I get the information around it and then it kind of moves back out. like there's some uh a little bit of like you know magic that can happen in the motion dynamics of that right how information comes up and information goes down I think you can prompt all that stuff out relatively easy yeah I know we're like faking it but this whole thing is fake so so there you go
Shantanu Singh: Okay. Yeah. What? What do we do about the token problem?
Nasahn Sheppard: f******
Shantanu Singh: Can we share what

Nasahn Sheppard: tokens this is the bane of my existence Alex get us tokens
Aditi Sharma: Yeah, I'm out.
Alex Kahng: Wait, you don't have infinite
Shantanu Singh: we do?

00:23:57

Aditi Sharma: No,
Nasahn Sheppard: We do not we get we are metered dude we get we get we get token
Shantanu Singh: You have internet token.
Alex Kahng: tokens.
Aditi Sharma: you have internet tokens.
Nasahn Sheppard: maxed like like don't even get me started like every day.
Shantanu Singh: $250 token.
Nasahn Sheppard: So
Shantanu Singh: Uh he finished 200 yesterday.
Aditi Sharma: I'm out today morning.
Shantanu Singh: Oh, you're out
Aditi Sharma: I'm out.
Nasahn Sheppard: yeah we get one day's worth of design every month.
Shantanu Singh: already.
Alex Kahng: What?
Aditi Sharma: Yeah.
Nasahn Sheppard: How's that?
Alex Kahng: Okay, that's weird. Uh, are there API keys that I'll have access to to give me infinite and
Shantanu Singh: It is on GitHub.
Nasahn Sheppard: Um,
Alex Kahng: Salesforce?
Shantanu Singh: But uh yeah you you basically then but Aditi can't use your token. So if you can give us
Aditi Sharma: And there's no way to import projects within cursor to windsurf. Like I have a lot of windfur tokens but I can't import
Shantanu Singh: to
Nasahn Sheppard: I mean, the other thing you can do is you can you can hop, which sucks,

00:24:41

Aditi Sharma: anything.
Nasahn Sheppard: but you basically take all of your prompt, everything you have, and you, you know, pass it over to like, you 10 May and then he he he runs and then you you sit with him and he he exhausts his tokens and then you pop over super and you exhaust his tokens and then you pop you know that is the that is the only hack that I know and
Aditi Sharma: Use other people's
Nasahn Sheppard: it's you just suck up everybody's tokens around
Aditi Sharma: cursors.
Nasahn Sheppard: you.
Alex Kahng: Okay. Well, there was an announcement today. Human agent productivity unlimited tokens for everyone under Sheeny.
Shantanu Singh: Amen.
Alex Kahng: Did you see that?
Nasahn Sheppard: Yeah,
Aditi Sharma: I don't know what I'm feeling.
Nasahn Sheppard: but we are not under
Alex Kahng: Yeah, I I I get it. But uh so does that mean you guys can take
Nasahn Sheppard: Sheeny.
Alex Kahng: control of any engineer somehow and leverage them somehow? Can we pair pair you off with someone for
Shantanu Singh: Yes.
Alex Kahng: today?
Nasahn Sheppard: Uh yeah.

00:25:43

Shantanu Singh: If that person don't have anything to do and can stay with us for 12 months.
Nasahn Sheppard: Yeah. Basic basically that person will uh look you can find somebody and nuke their day and then we can and then just tell them exactly what to do and then you just send them all the prompts then sure. But um but this is a this is actually like a a

real legit problem.
Alex Kahng: like get on a pair code session for the day.
Nasahn Sheppard: Like engineering gets all the engineering gets all the toys and design gets you know the f****** peanuts.
Alex Kahng: Yeah,
Aditi Sharma: Can we not escalate it just for like one use case just to get some extra tokens like
Alex Kahng: that's horrible.
Nasahn Sheppard: and
Aditi Sharma: for just this week?
Shantanu Singh: We're talking about now problem.
Nasahn Sheppard: uh so so
Shantanu Singh: Yes, we can. But how do we do it now for tomorrow
Aditi Sharma: Like
Nasahn Sheppard: Dan Dan Leoff is the person to escalate it to.
Shantanu Singh: if
Nasahn Sheppard: I know that they have a little bit of a secret squirrel stash of Figma make tokens.

00:26:29

Nasahn Sheppard: I don't know if they have extra cursor tokens or anything else, right? Um uh you can also I mean you can also we can escalate to Yakov and be like hey man like we need we need stuff we need it now. Um the problem is like everyone's going to be offline and you need this today. And so um
Shantanu Singh: Yeah, that's that that's what I was saying that everybody in US who you can escalate would have logged off.
Nasahn Sheppard: yeah DJ, are you in the office today or are you at home?
Aditi Sharma: I'm at home, but I can go. It's a short drive.
Nasahn Sheppard: Which remind me which office are you in?
Aditi Sharma: The
Nasahn Sheppard: So who who in Bangalore office is going to be there today and and has all the tokens?
Aditi Sharma: Bangalore.
Nasahn Sheppard: You just suck all their tokens up. Just have them sit with you and
Shantanu Singh: No one is in team at least.
Nasahn Sheppard: just

Aditi Sharma: Everyone is in release
Shantanu Singh: British all of them would have finished their

00:27:21

Aditi Sharma: planning.
Nasahn Sheppard: Oh my god. This token thing is going to be the end of my existence.
Shantanu Singh: tokens.
Nasahn Sheppard: I swear to God. I have, by the way, I've I have I have escalated this multiple times and so um
Tanmay Jyot: Nan, can we use MX to buy token for one day? Is it
Aditi Sharma: Yeah,
Nasahn Sheppard: Oh, that's fine.
Aditi Sharma: please.
Nasahn Sheppard: Go ahead and buy tokens and expense it.
Tanmay Jyot: possible?
Nasahn Sheppard: I'll prove it if you can do
Shantanu Singh: We can do that.
Aditi Sharma: I don't think we can
Nasahn Sheppard: that.
Shantanu Singh: There's not even an option to buy token in that it's a corporate
Aditi Sharma: buy.
Tanmay Jyot: Okay. Okay. Ignore.
Nasahn Sheppard: Well, okay then.
Shantanu Singh: account.
Aditi Sharma: Can I buy Can I buy it on my personal claw and like have very different user case and nothing in it? I don't know.
Nasahn Sheppard: I uh can you stop can you stop recording this conversation?
Aditi Sharma: Sure. Sure. Sure.

Session ended after 00:28:11

00:39:25

Alex Kahng: Okay, we can just um so you so the story line

Tanmay Jyot: So or what we can do is um in in your head whatever is possible with
Alex Kahng: shape.
Tanmay Jyot: the resources that we have right now have a story line let's send it across to Alex and Mudu if they say this is fine we kind of create on top of that then does All
Aditi Sharma: Sure.
Tanmay Jyot: right.
Aditi Sharma: Okay. Um, so Alex,
Alex Kahng: Okay.
Aditi Sharma: you want me to take these notes and create a story line, correct? And you'll share it with
Alex Kahng: Uh, yeah,
Aditi Sharma: Mudu.
Alex Kahng: I I don't think any synchronous work will get done for the next 18 hours. Typically, Mudo and I can only sync and actually do work starting 5:00 p.m. starting 7:00 a.m. It's just a flurry of meetings. So, we probably won't see the document or I'll see it, but I won't have time with Mood to discuss it. Uh so if we I think we should take a stab at a use case.

00:40:29

Alex Kahng: What what is the current use case that we have?
Aditi Sharma: Uh there is like an IT director at Home Depot who is sort of managing all the
Alex Kahng: It's
Aditi Sharma: agents and they are trying to make sure all their agents who are deployed
Alex Kahng: Mhm.
Aditi Sharma: through like agent force co-pilot and third party MCPS they all are like not violating policies they are within the
Alex Kahng: Okay. lots of third party agents across
Aditi Sharma: pipeline
Alex Kahng: um I guess hyperscalers uh plus Salesforce um and then what was the issue that we narrow in on the exact
Aditi Sharma: the rogue agent needs to be caught.
Alex Kahng: issue?
Aditi Sharma: Um,
Alex Kahng: Mhm.
Aditi Sharma: Monrog agent uh sort of neutralized. Then the other issue was like I think

what Mudu mentioned and I need to still go through the notes was that the IT man IT director can go through um each agent very granularly and see what they have access to.
Alex Kahng: Okay. So is that a remediation action? So like the IT director reduces the scope of the agent.

00:41:56

Alex Kahng: So it stops approving uh like out of policy.
Aditi Sharma: But that's not something they
Alex Kahng: So what is the issue and then what's the remediation action? How are we going to re restart that agent?
Aditi Sharma: mean for Now, we're not thinking about restarting like we're just thinking about neutralizing the rogue
Alex Kahng: Okay,
Aditi Sharma: agent.
Alex Kahng: that to me isn't um like close closing the issue because it's just going to just going to pop up again, right?
Aditi Sharma: Okay. So, maybe like send them back for testing and like go on
Alex Kahng: Yeah. Yeah, exactly.
Aditi Sharma: check.
Alex Kahng: It should be updating the eval for the agent and having it go back to the factory to relearn how to behave and then uh redeploy the agent once it's trained
Aditi Sharma: Got it.
Alex Kahng: up.
Aditi Sharma: So that is one story line FYI like catching a rogue agent
Alex Kahng: Okay. But but but this is too vague for me.
Aditi Sharma: you
Alex Kahng: What is the policy document or what is the guard rails?

00:43:09

Alex Kahng: I think
Aditi Sharma: like for example like what I showed just now like this agent does not have access to the payment API but somehow they found it they they've not been approved

access for payment APIs
Alex Kahng: That's too I see. I mean that that's okay. Is there something that's more uh newsworthy? like what is something that's uh a common IT issue or information security breach type thing um h or something that could be a become a security breach. Uh I mean that's Gemini Gemini. First of all nightmares AI agents deployed two. Okay. Something Yeah. Okay. Gemini is not helpful. Yeah. I guess we can just maybe come up with a scenario and then you can send it to me. I can asynchronously review. I don't know if I
Aditi Sharma: any chance like if you just even do like a voice memo and you send it to Gemini like what you're thinking because I don't have enough knowledge about either of these things.

00:45:39

Aditi Sharma: So even if you just give me like some sort of like natural language story line this is what the director sees this is what they do because what I can come up with is like you know like getting access to payment gateways more details about that I'm not aware
Alex Kahng: Okay.
Aditi Sharma: of
Alex Kahng: So the IT director will see um a land I guess not a landscape but they'll see the maximally zoomed out view of all assets right it's a CMDB type view but um I guess you get the highle insights and you get all of the flags um they're going to see one about an a rogue agent which is violating some policy document. It's its behavior is not compliant according to this maybe in um it's violating a guard rail or it's doing it found a loophole. It's using up too many tokens or it's um approving something it shouldn't uh or it's going to turn into a larger issue. It might not be violating anything yet, but it's starting to give DIY advice to customers or it's it's doing something that might be becoming that might be off the rails and then the IT director can zoom in on this agent and they can zoom in uh into the blast radius of the agent as um the agent is going to interact with all these customers, all these users.

00:47:19

Alex Kahng: You should be able to as you're zooming in, you should see things come to

life in higher detail. So, this agent has that bad behavior and it's exhibited across all of these customers in the surface area. And I can see that in the, you know, one zoomed in view, there's like six related customers in that graph. Uh, and there's a couple of red arrows, red exclamation points on these customers because that bad behavior has been exhibited there. But if I even go in further, I can go and check those exact sessions, those exact interactions, I could also zoom into the the architecture of the agent. Uh instead of just looking at the interactions, we have to figure out which what's the better view. But if you zoom in on the architecture of the agent, you'll see the agentic workflows underpinning this uh like this agentic behavior. And we should go down into the exact node as to when the bad behavior was exhibited and we should be able to say okay this needs to be fixed. Here's a like the generally the bad behavior is this according to the policy document.

00:48:35

Alex Kahng: Please re um assess your eval set. Reassess this agent, change the evals or do whatever is needed so that the agent starts behaving properly or starts behaving in a more defensive manner. Um so your IT director is not going to get fired, right?
Aditi Sharma: All
Alex Kahng: They should be able to lock down this agent which still needs to be deployed in production like any other service but just needs to be behaving more defensively uh CYA type type thing and I think once the agent gets redeployed that's the same thing as you know rogue agent
Aditi Sharma: right.
Alex Kahng: neutralized but it's less palunteer-ish um and instead you you should just be able to instantly redeploy the agent and see um like the issues go away in the service graph or the issues start to go away over time. Um like let's say it could be life cycle of the agent
Aditi Sharma: So that would be shown in the life cycle of the agent, right?
Alex Kahng: or if there's let's say this agent's deployed in some production environment. It's customerf facing or it's uh interacting with all these other services and we're seeing these exclamation points come up at a like three every minute.

00:49:59

Alex Kahng: We're getting three uh warnings once the new agents deployed. Now we're getting zero new ones every minute. So it looks like things are better now. But even though this agent is still having all those interactions something like that like
Aditi Sharma: Watch
Alex Kahng: the like you can show the rate of issues or the overall score based
Aditi Sharma: out.
Alex Kahng: on the policy document for this agent has improved some I don't know what this agent would be but maybe we show two issues one is IT related one is HR related uh for agents that one would deploy at Home Depot. Okay, that's Is that helpful? I have to drop to the other one.
Shantanu Singh: Hey uh Titi Aditi, are you clear on what is is it helpful? Is
Tanmay Jyot: I am I am I am lost. I am not able to get the holistic idea.
Shantanu Singh: it
Tanmay Jyot: Shantu this is what I think we can do whatever information we have we can build on top of it but again the token issue is a real thing so we can't promise anything Alex we have we don't have to token so if Aditi is not able to get anyone else it stops here this is all we have right but apart from the if you get no token whatever

00:51:31

Alex Kahng: Okay.
Tanmay Jyot: you're told right now we'll try to piece it piece it up and get something out there
Alex Kahng: Yep. Okay.
Tanmay Jyot: Yeah.
Alex Kahng: That's good.
Tanmay Jyot: Okay, Alex.
Alex Kahng: Yeah.
Tanmay Jyot: Thanks.
Alex Kahng: Thanks.
Tanmay Jyot: But yeah,
Shantanu Singh: Thank you.
Tanmay Jyot: you there.
Aditi Sharma: Yeah. I'm just going to start plugs.
Tanmay Jyot: Oh, seat.

Session ended after 00:51:55

01:00:59

Aditi Sharma: Okay.
Shantanu Singh: It is you can
Aditi Sharma: By global you mean department organization like let's say
Shantanu Singh: start
Aditi Sharma: sorry.
Shantanu Singh: location can do that.
Aditi Sharma: Okay. Okay.
Shantanu Singh: Now from there what you you let's say you you saw a flag
Aditi Sharma: Okay.
Shantanu Singh: there and you moved into that. When you moved into that what do you see next? You see then you see the cmd sort of
Aditi Sharma: Agent is marked as locked.
Tanmay Jyot: uh cmdb view will only come when you go to an individual agent
Shantanu Singh: view
Aditi Sharma: Okay.
Tanmay Jyot: cmd. So when there is an individual agent that will connect to different uh hardware and software and API and all of those things.

01:01:44

Tanmay Jyot: So that is the cmdb view.
Shantanu Singh: no wait.
Tanmay Jyot: Then
Shantanu Singh: So zoom out that view. accessware. Now for that location where you are zooming in, think about in that location all the people's all the agents, all the software how they are connected with each other. and then one is flagged. So then you zoom into it and then you will see the next layer of CMDB graph which is particular agent connected workflow then you kill it. So from I mean if you don't do it in a CMDB view you do it in some other view but the point is from that location to the last mile last CI zoom in zoom out what will be the intermediate views look like? So, California level

and then a class CI. A last CI could
Tanmay Jyot: It's just the agent actually the agent maybe in the right hand panel you showed now there was
Shantanu Singh: be
Tanmay Jyot: another um symbol where you were it was connected to other three four things right that's the view you just bring that view in the center console that will be a CI

01:03:36

Aditi Sharma: Come
Shantanu Singh: You will not come directly into one agent.
Aditi Sharma: on.
Shantanu Singh: You will have a beach view like zoom in zoom out at multiple levels.
Tanmay Jyot: So,
Shantanu Singh: That's what the feedback
Tanmay Jyot: huh correct department let's have a department hierarchy.
Shantanu Singh: was.
Tanmay Jyot: Okay. Home Depot. Home Depot. Let's say there is a ecommerce thing. E-commerce check out that can be the
Aditi Sharma: Right.
Shantanu Singh: Huh? Location. You're going into one location. Within that there are further location and then
Tanmay Jyot: But the moment we say why to get into that discrepies department
Shantanu Singh: Okay. Okay.
Tanmay Jyot: then we get problem Um that that is one way to department view maybe a location
Shantanu Singh: Zoom in, zoom out. How can I go filter filter filter?
Tanmay Jyot: view.
Shantanu Singh: The other thing one one thing which I so ad the one design the design that you have currently the right panel it is all point and click I think what Nashan was saying is there is an agent force conversation layer and I'm talking it and it is also doing filtering or whatever is required based on the instruction I'm giving agent

01:05:25

Aditi Sharma: Oh.
Shantanu Singh: force so Which makes sense. You need to have an agent force layer in something like this where you are talking with it. Not just point and
Tanmay Jyot: Correct. But conversational is very
Shantanu Singh: click.
Tanmay Jyot: difficult.
Aditi Sharma: cursor project.
Tanmay Jyot: I mean with the time limit that we have yeah feasible the other thing will
Shantanu Singh: Hey, fair enough. So, first of all,
Tanmay Jyot: be
Shantanu Singh: let's not try to make an end to end working prototype, end to end project. Okay, it won't be possible if so the feedback of having a conversation layer and using it to filter or using it to make task that has two aspects. one putting a conversation layer or a component on the screen that can be done. Whether you make that comp conversation layer working or not that is a different
Aditi Sharma: Got
Shantanu Singh: form
Aditi Sharma: it.
Shantanu Singh: when you come to whether you want to make it or not.
Aditi Sharma: Just
Shantanu Singh: Do you want to make it like a complete thing where I can say anything and it will respond or do you want to just hardcode one one layer of interaction?
Aditi Sharma: Just trying to think like what the overall structure will look like. Um, okay. I need like five minutes to read through this.
Tanmay Jyot: You can see let take
Shantanu Singh: Oh yeah, why don't you take your time and uh use
Tanmay Jyot: a
Aditi Sharma: And also one of the thing that if we all can align is key basically a we don't
Shantanu Singh: your
Aditi Sharma: know what uh these people want correct to say what
Tanmay Jyot: correct
Aditi Sharma: is the best and best that we can do in 24 hours
